The HTML Parser is a library supporting the HTML5 Parsing APIs: the Document Object Model (DOM) API, the HTML5 Database API (e.g. IndexedDB), the HTML5 Forms API and others. The HTML Parser is a C# library, that supports.NET Framework, Mono/Linux and Windows platform. The goal of this project is to provide an

easy-to-use, complete and efficient HTML parser in the form of a C# class library. HTML Parser - is an XSD file that indicates the expected structure of the HTML document and its payload. It is also composed of C# code that intercepts the XSLT transformation, the DOM traversal and the HTTP request/response. The HTMLParserXSLEngine component is like a dictionary that contains

mappings between XML elements and XSLT rules. This component is used to execute XSLT transformations in the Web browser. Using the XSLT engine allows you to do simple tasks such as preprocessing, rendering, manipulation of dynamic content, transformation of embedded resources and so on. You can also use additional elements or attributes from the

returned HTML document to enrich the transformation rules and the mapping between elements of the HTML and XML documents. The goal of this project is to offer a very easy to use, performant and generic implementation of the entire HTML parsing process. This means that you won't get the DOM (Document Object Model) through custom classes. Instead, you will get the

DOM through the XPath selector, which is the most intuitive and powerful way to query the source document. Another goal of this project is to provide an easy-to-use library for parsing a list of HTML files. The HTMLParser will allow you to parse a data file in an easy way and create a data structure that can be easily used to display the data in a web browser. Mozekty Play Your
