XML-based AutoLISP and VBA AutoLISP is a proprietary programming language developed by Autodesk and Autodesk Labs. The language uses ANSI C syntax and supports three kinds of variables: numeric, string, and array variables. AutoLISP was the original starting point of the development of AutoCAD and it has been in use since version 2.0. AutoLISP allows for customizing most aspects of AutoCAD, such as toolbars, menus, and commands. VBA is a programming language used for Microsoft Office. VBA was designed for Microsoft Office and the add-in development process was developed. It is based on object-oriented programming, is multi-paradigm, and supports dynamic arrays, named ranges, arrays, functions, modules, events, methods, properties, events, user forms, user control, constants, and structures. VBA requires no programming skills and makes it easy to create custom tools. VBA can be embedded in Excel or PowerPoint files, and it can access external databases and websites. It also enables a developer to create toolbars and macros that are cross-browser compatible. VBA can be used to manipulate Excel and PowerPoint documents. In addition to creating add-in development for Office, VBA can be used to create Office-based web applications. ObjectARX ObjectARX is an open source object-oriented application programming interface (API) for AutoCAD, written in C++ and designed for integration into other AutoCAD-based applications. Its development has been led by Autodesk Labs with contributions from the CERN Laboratory. It is an object-oriented replacement for the internal AutoLISP programming language. It contains two versions: Version 1.2.2 (for AutoCAD 2000–2013) and Version 1.4.0 (for AutoCAD 2014 and higher). ObjectARX is available for Windows, Linux, Mac OS, Android, and iOS. It is compatible with both Windows and Linux. Non-volatile memory devices have data programs that are stored without an external source of power. The data programs are retained in the non-volatile memory cells even when power is removed from the non-volatile memory device. Non-volatile memory devices are widely used in devices such as electronic communications, digital computing, microcontrollers and other applications. Typically, a non-volatile memory cell includes a floating gate formed from a floating gate electrode and a control gate electrode. The floating gate electrode is used to store a single data bit. A charge is placed on or removed from the floating gate electrode during programming, read or erase operations. The floating gate electrode has a first portion referred to as the source, and a second portion referred to as the drain. The floating gate electrode includes a first region that is in a conductive state and a second region that is non-conductive. The second region is referred
